

Week 6 FAQ

[Help](#)

Source Code

The first video contains only code snippets, a complete sample is given with the second video:

- [Lifecycle Monitoring and the Error Kernel](#)

The third video does not contain concrete code examples because the persistence solution discussed in the lecture is currently being integrated into Akka. You can take a look at the [eventsourced](#) project, which forms the basis for the new [Akka Persistence Module](#). The artifact for the former is accessed in sbt by putting the following lines into `build.sbt`:

```
resolvers += "Eligosource" at "http://repo.eligotech.com/nexus/content/repositories/eligosource-releases/"

libraryDependencies += "org.eligosource" %% "eventsourced" % "0.6.0"
```

(please note the empty line)

The latter can be tried out using a milestone build of Akka. For this replace the Akka version in `build.sbt` with `"2.3-M1"` and run the "eclipse" task again.
